ABSTRACT

Background and objective: The safety of plant-derived bioactive compounds has become a global concern. The present study investigated the acute toxicity of aqueous and ethanol extracts of Dialium guineense stem bark using Wistar rats. Methods: Adult male Wistar rats (n = 13) weighing 150 – 180 g (mean weight = 165 ± 15 g) were used for this study. The aqueous and ethanol extracts of the plant stem bark were obtained using cold maceration method. Lorke method was used to determine oral LD50 of the extracts. Signs of toxicity and possible death of rats were also monitored for twenty-four (24) h. Results: The major signs of toxicity observed within 24 h were: difficulty in breathing, loss of appetite and general weakness. No deaths were recorded in both phases and all the animals in each phytochemical group survived. The oral LD50 of aqueous and ethanol extracts of D. guineense were greater than 5000 mg/kg body weight (bwt). Conclusion: The results of this study suggest that aqueous and ethanol extracts of D. guineense stem bark are not toxic at doses not exceeding 5000 mg/kg bwt.

Keywords: Dialium guineense, Acute toxicity, Rats, Extract, Lethal dose.
INTRODUCTION
In recent times, plant-derived substances have become of huge importance to man due to their many applications. Extraction methods involve the separation of medicinally active portions of plant tissues from the inactive/inert components using selective solvents [1 – 3]. These plant components exist as complex mixtures of many medicinal metabolites, such as alkaloids, glycosides, terpenoids, phenols, flavonoids and lignans [4 - 6]. Medicinal plants have long been recognized as important sources of therapeutically active compounds [7]. Evidence-based research supports the medical and pharmacological benefits of plant-derived compounds with interest in the identification and characterization of bioactive compounds from natural sources [8 - 10].

*Dialium guineense* (Velvet Tamarind), is a tall, tropical, fruit-bearing tree which belongs to the Leguminosae family. It has small, typically grape-sized edible fruits with brown hard inedible shells. *Dialium guineense* grows in dense forests in Africa along the southern edge of the Sahel and it can be found in West African countries such as Ghana where it is known as “Yoyi”, Sierra Leone, Senegal, Guinea-Bissau and Nigeria where it is known as “Awin” or "Igbaru" in Yoruba, “Icheku” in Igbo, “Tsamiyarkum” in Hausa and “Amughen” in Edo. The bark and leaves have medicinal properties and are used against several diseases [11]. Despite the widespread use of *D. guineense* in medical research, the safety of its bioactive components is rarely reported. Extracts of the plant are reported to be rich in important phytochemicals [12, 13]. The present study investigated the acute toxicity of aqueous and ethanol extracts of *Dialium guineense* stem bark using Wistar rats.

METHODS

Experimental rats
Adult male Wistar rats (n = 13) weighing 150 – 180 g (mean weight = 165 ± 15 g) were obtained from the Department of Anatomy, University of Benin, Benin City. The rats were housed in metal cages under standard laboratory conditions: temperature of 25 °C, 55 – 65 % humidity and 12-h light/12-h dark cycle. They were allowed free access to rat feed (pelletized growers mash) and clean drinking water. Prior to commencement of the study, the rats were acclimatized to the laboratory environment for one week. The study protocol was approved by the Faculty of Life Sciences Ethical Committee on Animal Use.

Collection of Plant Material
The stem barks of *D. guineense* were obtained from Auchi Area of Edo State, Nigeria and authenticated at the herbarium of the Department of Plant Biology and Biotechnology, University of Benin, Benin City.

Plant preparation and extraction
The stem bark was brushed and shade-dried at 30 °C for a period of two weeks and crushed into small pieces using clean mortar and pestle. Aqueous and ethanol
extracts of the stem bark were obtained using cold maceration method as described previously [14 - 16].

**Acute toxicity test**
This was carried out using the Lorke’s method [17], which comprised two phases. In the first phase, nine (9) rats were divided into three groups of three (3) rats each. Each group of rats was administered aqueous or ethanol extract of *D. guineense* stem bark orally at doses of 10, 100 and 1000 mg/kg bwt. The rats were placed under observation for 24 h to monitor their behavior and mortality. In the second phase, 4 rats were randomly assigned to four groups of 1 rat each. The rats were administered higher doses of aqueous or ethanol extract of *D. guineense* stem bark orally at doses of 1600, 2900 and 5000 mg/kg bwt, and then, observed for 24 h for signs of behavior and mortality.

The lethal dose (LD$_{50}$) of aqueous and ethanol extract was calculated thus:

$$LD_{50} = \frac{\sqrt{D_0 + D_{100}}}{2}$$

where $D_0$ = Highest dose that gave no mortality, $D_{100}$ = Lowest dose that produced mortality.

**DISCUSSION AND CONCLUSION**

There have been growing interests in the toxicity of substances purified from plants basically to determine their safety. This study investigated the acute toxicity of aqueous and ethanol extracts of *Dialium guineense* stem bark using Wistar rats. The results showed that no death was recorded in both phases after 24 h and all the rats in each group survived. The major signs of toxicity observed within 24 h were: difficulty in breathing, loss of appetite and general weakness. Thus, the median lethal dose LD$_{50}$ (oral) of aqueous and ethanol...
extracts of D. guineense stem bark were greater than 5000 mg/kg bwt. These results suggest that the aqueous and ethanol extracts may be relatively safe [16]. One major and overriding criterion in the selection of herbal medicine for use in health services is safety. Phytochemicals present in plant extracts should not only be clinically effective, but safe for consumption. Therefore, screening of bioactive components present in plant extracts to identify their toxic potentials is necessary for selection of plants for drug formulations [18 - 20].

**SIGNIFICANT STATEMENT**
The results obtained in this study show that aqueous and ethanol extracts of D. guineense stem bark are not toxic at doses not exceeding 5000 mg/kg bwt.
