TO STUDY PHYTOCHEMICAL SCREENING AND HPLC ANALYSIS PLANT EXTRACT OF *LANTANA CAMARA*

Dr. Amit C Lingayat

(Professor ,Department of Dravyaguna,YCAMC, Aurangabad)

ABSTRACT

Since ancient time the herbal medicines are effective in the treatment of various ailments. Therefore, these plant drugs deserve detailed study in the light of modern science, and their taxonomical relatives can lead to the development of invaluable plant drugs for many dreadful diseases. In the present article we are discussing regarding the phytochemical and HPLC analysis of plant extract *Lantana camara*.

Key Words: Phytochemical Screening, *lantana Camara*.

INTRODUCTION

The essential values of some plants have long been published, however, a large number of them remain unexplored as yet. The most important of these bioactive constituents of plants are alkaloids, tannins, flavonoids, and phenolic compounds (Hill, 1952, Ali et al., 2001). Lantanoside, linarioside and camarinic acid have been isolated and are being investigated as potential nematocides (Day et al. 2003). Lantana oil is sometimes used for the treatment of skin itches, as an antiseptic for wounds, and externally for leprosy and scabies (Ghisalberti 2000). Plant extracts are used in folk medicine for the treatment of cancers, chicken pox, measles, asthma, ulcers, swellings, eczema, tumors, high blood pressure, bilious fevers, catarrhal infections, tetanus, rheumatism, malaria and atoxy of abdominal viscera (Ghisalberti 2000, Day et al. 2003). Lantana twigs and stems serve as useful fuel for cooking and heating in many developing countries (Sharma et al. 1988). Polyphenols especially TF exert cancer chemo preventive activity of inducing apoptic signals. (Lu et al., 1997, Yang et al., 2000, Javed et al., 1998). The anti inflammatory activity of the Bioactive Compound Oleanonic acid were tested against through the carrageen an induced Rat – paw Oedema model (Ghosh et al., 2010)

In the present investigation, we report our findings on the total extractions of chemical components of the plant by HPLC method.

Materials and Methods

Plant materials are collected from university botanical garden and the identified plant was confirmed by plant taxonomist. The preliminary phytochemical screening tests were carried out on the aqueous leaf crude extract of *lantana Camara* using standard procedures to identify the constituents.

Extraction of the Compound

For crude extraction fresh plant material were washed with tap water, air dried and homogenized to fine powder and stored in air tight bottles. 10gms air dried powder mixed with 100 ml water at 37 °C for 48 Hrs. filtered in muslin cloth centrifuged at 500 g for 10 min. The supernatant was stored at 4 °C

The compound can be extracted from above supernatant by passing through the column and is first fitted with Cotton and then silica gel, activated charcoal and again silica gel in ratio 1:2:1 and the crystals of plant extract are collected.

HPLC Analysis

The *lantana Camara* leaf extracted and purified compound was tested for the compound conformity and purity. The compounds extracted from leaf, stem, root and flower were set up for HPLC (High performance liquid chromatography) to test the purity of the compounds. In the HPLC mobile as well as stationary phases are used to test the purity of the compound. Usually a single gradient or a

binary gradient are used as mobile phase. From the already available data it is known that the mobile phase used are shown in the figures itself. The detector used here is D₂ lamp as the measurement of the sample is <400 nm. The run time was set to 1 ml/1min. An injection volume of 20 ul is injected in to the stationary phase column. The gradient program was set up and the peak analysis was estimated by observing the graph and comparing the obtained chromatogram with that of the already available data (Plumb et al., 2004).

RESULT AND DISCUSSION

Phenolic compounds are reported to the active quenching oxygen –derived free

radicals by donating hydrogen atom or an electron to the free radical .It has been well known that plant materials have been well known that plant materials have shown to neutralize free radicals in various invitro model systems (Zohang et al.,1996).Earlier the poly phenolic compounds have protective effects on mutagenesis and carcinogenesis in human when ingested 1g daily from a diet rich in fruits and vegetables (Tanaka et al.,1989).The phenolic and flavonoid contents results of phytochemical analysis were carried out by HPLC method.

Table 1: Phyto Chemical Screening of *lantana Camara*

Qualitative Test <i>Camara</i>	<i>lantana</i>
Terpenes	Higher
Fixed Oils	Medium
Flavones	Higher
Alkaloids	low
Glycoside	Nil
Sterols	Nil
Phenols&Tannins	Nil

Bioactive potential of Flavonoids has been reported.(Illic et al.,2004 ,Cushner and Lamb 2005).The present results comparable with that of Samy and Ignace Muthu (1999).Sanchez et al (2005).

who reported the antimicrobial activity..In light of the fact that Micro organism are becoming resistant against the drugs in use , present investigation is of great importance in pharmaceutical industries for preparing plant based antimicrobial drugs.
